

The Degreed Point System

Increasingly, people are learning from a diversity of sources over the entirety of their lives. Degreed normalizes and summarizes an individual's full educational history, enabling skill profiling and a smart system that can better serve the learner by knowing what each individual knows. The science behind the scoring is patent pending and was informed by expert Larry Rosenberger, the former CEO of FICO and the man behind the science of the FICO credit score and David Wiley PhD, a global leader in instructional design and open education.

This point system relies on the world's largest database of educational content. The score is a function of duration of an educational experience, one point is roughly equal to one hour of learning, weighted by several factors including difficulty and quality. Authoring content yields a higher score.

Points help learners gauge their progress and set quantified goals related to learning--regardless of provider or format of the learning. In a world where educational experiences are becoming increasingly diverse, Degreed enables learners and organizations to tie it all together in a meaningful way driving insight, action, and further growth.
